

SOA

Surgical outcomes application

Overview

The Surgical Outcomes Application (SOA) is meant to be used by cardiac surgeons, to document their surgical outcomes. These outcomes are available in real time and completely confidential. These outcomes are owned by the surgeon and independent of the hospital where the surgeon is currently working. Since we are only recording procedures there are no privacy concerns. This presentation highlights the features of the application and this presentation gives a short guided tour of the application.

Features of the SOA

1

Real time outcomes, presented with VLAD graphs. Helpful statistics featuring graphs of caseload and casemix among others.

2

Connection with online valve inventory.

3

Personalized procedure reports that facilitate and speed up the writing of procedure reports.

4

Battle proven in cardiac surgery practice. Over 20 years of continuous development and refinement.

A horizontal bar with a teal segment on the left and an orange segment on the right, located above the text.

Reasoning behind the SOA application

Surgical outcomes are important for your surgical career.

Reasoning behind the SOA application

You have 2 choices, let your outcomes be calculated by the administrators in your current hospital or

A horizontal bar with a teal segment on the left and an orange segment on the right, located above the text.

Reasoning behind the SOA application

Take control of your outcomes and use the SOA application. Obviously, this last choice is better because

Reasoning behind the SOA application

You are in a better position to gauge the preoperative risk, which directly influences the surgical outcome. And the uneventful continuation of your career.

Reasoning behind the SOA application

The SOA application takes the administrative pain out of the outcomes administration because it generates helpful statistics and sophisticated procedure reports which can be fully adapted by you to your preference. You will enjoy using it.

Reasoning behind the SOA application

Let's have a look

Comments

The procedure details are listed in the navigation bar and change depending on the type of procedure done. For example a CABG operation has a CABG details page, whereas a Valve procedure has no CABG details page

Subsequently you can preview the procedure report.

After filling the details pages the surgeon concludes the procedure with the procedure report. These personalized reports are highly appreciated by the patient and family and reduce the administrative burden of the surgeon, because every surgeon has his/her own report for all the procedures that they regularly do. Every line in the green zone can be changed before the report is printed to pdf.

After the pdf of the report is printed or emailed the surgical administration is finished.

Before discharge of the patient the discharge details page needs to be completed. This also finishes the surgical outcomes administration for this procedure and will update the VLAD graph and mark the procedure as completed in the procedure list page.

This next VLAD graph shows only 14 procedures and is for demonstration only. You can look at your outcomes overall or select the hospital you are interested in. We can think of all kinds of interesting statistics, on the left side of the graph we see a couple of buttons that represent different database queries. These might be especially handy for surgeons in training.

A quick recap

This Surgical Outcomes Application (SOA) was designed with cardiac surgeons in mind.

SOA gives real time surgical outcomes and a very much reduced administrative burden.

SOA was designed to be fully independent especially from the hospital where the surgeon works.

These procedure data are not anonymized, but anonymous from the start of collection therefore there are no privacy concerns.

The surgical data and outcomes are the property of the surgeon and can only be reviewed with the surgeon login credentials.

SOA is a perfect companion for the cardiac surgeon in training

Subscription service

This application is offered as a subscription service. This means that you do not need any on-premises computer hardware. The maintenance is done by us and you do not have a major financial commitment.

Pricing

Under consideration, we are thinking of a limited free service which will depend on advertisement and a paid subscription for heavy users.

The End
